

AI Shop

Find the right product.

Decide with evidence.

Match needs · Compare prices · Review evidence

Shopping starts with the person—not the product.

WHY AI SHOP

People know the outcome they want, but shelves make trade-offs hard. AI Shop identifies suitable products, surfaces visible options and price context, and explains what is still uncertain—while the shopper stays in control.

Find the best fit— not just the first match.

NEEDS ♦ PRICE CONTEXT

Target Product looks deeply at one option. Area Scan surveys alternatives across the shelf. Together they help shoppers compare visible features, price labels and availability against what they actually need.

A photo turns shelf choice into a guided decision.

01 · EXPRESS

Start with the need

Choose one product for depth or scan a shelf to discover options.

02 · COMPARE

Capture useful context

Frame products, packaging, price labels and nearby alternatives.

03 · DECIDE

Act with confidence

Review findings and uncertainty, compare options, then choose for yourself.

One product for depth. A whole shelf for choice.

DEPTH ♦ BREADTH

Target Product explains one option, including fit, confidence and missing price evidence. Area Scan organizes visible alternatives so the shopper can compare the shelf and decide what deserves a closer look.

The iPhone, cloud and dashboard share one evidence trail.

01 · IPHONE APP

Capture in context

The native camera sends the exact JPEG, scan mode and target metadata over HTTPS.

02 · FIREBASE + AI

Analyze and preserve

The server stores private evidence, runs structured AI analysis and records immutable findings.

03 · REVIEW WEB

Verify and learn

The authenticated dashboard shows image and findings side by side and records human decisions.

AI findings remain evidence—not the final authority.

MACHINE INTERPRETATION

The original image and hash stay linked to the scan mode and structured findings. The first AI result remains unchanged.

HUMAN DECISION

An authorized reviewer compares evidence and findings, then records Verified, Corrected or Rejected as a separate, attributable decision.

The dashboard keeps every decision traceable.

AUDITABLE BY DESIGN

Reviewers open the original retail image beside the initial AI findings, add notes, and preserve an attributable decision history without changing the first result.

Specifications guide every agent-assisted change.

INTENT FIRST

Use cases and architecture define behavior and boundaries.

COMPONENT-SCOPED TASKS

Each sprint task changes one named component and its tests.

HUMAN APPROVAL

Governed documents require review before coding, commit, deployment or release.

The prototype proves a path from shopping need to retail intelligence.

PROVEN TODAY

Native capture, Target and Area reports, private evidence, server-side AI and authenticated human review work end to end.

WHAT COMES NEXT

Product catalogs, live availability and price context, personalized needs, retailer workflows, analytics and production controls.
