

AI Shop

See products. Decide with evidence.

Native iPhone app · AI analysis · Human review

A shopping image becomes a clearer decision.

THE IDEA

Prices, quality and availability vary from store to store. AI Shop uses the camera as a second pair of eyes—identifying products, visible evidence and uncertainty while leaving the final choice to the person.

Choose what matters before taking the picture.

CHOOSE THE ANALYSIS

Target Product focuses on one selected item and its surrounding evidence. Area Scan looks across a shelf or display and organizes multiple visible products.

Use AI Shop in three simple steps.

01 · CHOOSE

Set the intent

Select one product for depth or a visible area for breadth.

02 · CAPTURE

Frame the evidence

Keep the product, packaging and price context clear in one image.

03 · REVIEW

Read the result

Review findings, uncertainty and the next action—then decide for yourself.

The response changes with the question.

DEPTH OR BREADTH

Target Product explains one selected item, including confidence and missing information. Area Scan creates a structured list of visible products and flags anything that needs another look.

AI findings remain evidence—not the final authority.

MACHINE INTERPRETATION

The server retains the original image, image hash, scan mode and initial structured findings. The initial findings remain unchanged.

HUMAN DISPOSITION

An authorized reviewer compares the evidence with the report and records Verified, Corrected or Rejected as a separate, attributable decision.

Review keeps evidence and decisions together.

AUDITABLE BY DESIGN

Pending and recent inspections stay visible. Reviewers can open the original image, inspect the initial AI output, add notes and retain an attributable decision history.

Specifications guide every agent-assisted change.

INTENT FIRST

Use cases and architecture define behavior and boundaries.

COMPONENT-SCOPED TASKS

Each sprint task changes one named component and its tests.

HUMAN APPROVAL

Governed documents require review before coding, commit, deployment or release.

Today's prototype is a foundation for a commercial retail product.

VALIDATED DIRECTION

Native camera capture, Target and Area reports, protected server-side AI, durable evidence and authenticated human review.

COMMERCIAL PATH

Product catalogs, store and price context, team workflows, analytics, retention and security policies, and production-grade operations.
